PROFESSIONAL PROFILE

Senior Software Engineer with end-to-end delivery experience across enterprise and startup environments, now building **LLM-powered product features in production**. I ship robust full-stack platforms with **Node.js/Express**, **React/Next.js**, **C#/.NET**, and **Swift**, and integrate Anthropic Claude and OpenAI models using tool use, prompt-based guardrails, structured outputs, observability, and inference cost control. Comfortable owning design and technical decisions from discovery through rollout, and translating those decisions for product, design, and non-technical stakeholders.

CORE SKILLS

Languages & Frameworks: C# (.NET 10), Node.js/Express, React, Next.js, TypeScript, Swift (iOS), Python, SQL

AI / LLM Engineering: Anthropic Claude & OpenAI APIs, Microsoft Semantic Kernel, agentic orchestration patterns, tool use / function calling, prompt-based guardrails, structured outputs (JSON schemas), trace/observability logging, retries & cross-model fallbacks, inference cost control

Cloud, DevOps & Tooling: Azure, AWS, Kubernetes, OpenLens, BOSUN, GitHub Actions CI/CD, PostgreSQL, MongoDB, Supabase, Stripe, Docker, Bruno; AI-augmented dev with Claude Code / Codex

Architecture & Ways of Working: Microservices, REST/GraphQL, event-driven, CQRS, DDD; TDD, feature flags, k6 (load), telemetry/SLOs; Agile (Scrum/Kanban), technical leadership, security & privacy by design (GDPR)

EXPERIENCE

Sainsbury's SSC — Senior Software Engineer

Aug 2024 – Present | London / Remote

- Led the migration of the internal **Activity App** from React to Next.js — the platform Sainsbury's uses to push activity and housekeeping tasks to store colleagues. Deployed to stores end of 2025; colleague feedback reported a **~60% workflow speed-up** off the back of UX and load-time work.
- Currently on the **Agentic team**, building the **Microsoft Semantic Kernel** layer for **Assist** (Sainsbury's colleague incident-reporting tool) that converts colleagues' natural-language descriptions into pre-filled forms; authored the spike benchmarking the five Microsoft AI Agent Orchestration Patterns and recommended the **Hybrid pattern** (classifier-routed parallel specialist agents with consolidated results).
- Previously helped deliver a **mobile hub consolidating the day-to-day apps store colleagues use**, combining iOS/Android natives, a Next.js webview, and C#/.NET services backed by MongoDB and PostgreSQL.
- Author **design-thinking documents and technical spikes** that align engineers, product, and non-technical stakeholders on direction; stood up CI/CD with GitHub Actions, reusable workflow templates, and environment-specific release gates (Azure, AWS, Kubernetes, OpenLens, BOSUN).
- Introduced **refinement meetings, templated PRs**, and consistent service documentation — lifting team productivity by **~15%**.
- Sainsbury's x Microsoft Hackathon: **2nd place** with a Power Apps solution using live store datasets to cut waste.

Rapiscan Systems — Software Engineer

Jul 2023 – Aug 2024 | Stoke-on-Trent

- In a department of **~10 engineers**, supported software integration across **8 hardware products** (C#, ASP.NET, Lua, Python).
- Led defect triage and fixes on a complex, hardware-integrated codebase; shipped instrumentation and structured logs that cut RCA time on cross-system issues.

Theone (Tech Startup) — Software Engineer • Contract (part-time, weekends)

Aug 2023 – Jan 2024 | Remote

- **Took full technical leadership** of the startup's MVP — a web platform to manage content generation and ad campaigns. **Node.js/Express** backend, Next.js frontend, PostgreSQL, Stripe, GitHub Actions CI/CD.

- Delivered end-to-end in **6 months** alongside my full-time role.

bet365 (Hillside Technology) — Software Developer

Aug 2021 – Jan 2023 | Stoke-on-Trent

- Part of a **~6-engineer team** maintaining in-house back-office tools and services used by the trading desk; stabilised legacy systems supporting revenue-critical workflows via targeted refactors.
- Drove debugging at scale and introduced structured logging/metrics to raise reliability.

Freelance — Software Developer (Web)

2023 – 2025 | Remote

- Owned client builds **end-to-end** — scoping, full-stack delivery (**React/Next.js + Node.js/Express** + database design), **Stripe subscription / recurring-billing integrations** across multiple clients, deployment, and direct client communication.
- Ran each engagement on a **calendared cadence** with clear milestones and regular check-ins, keeping delivery on-time and the work cleanly contained outside my full-time role.

PROJECTS

NIFL (2026) — nifl.app

Personal project, free to use · Sole developer

AI-augmented planning tool that turns users' saved places into real plans they actually do. Launched **May 2026**; **~60 users** with **~100 AI calls/week**.

- Built an **orchestration API layer** that lets pretrained LLMs (OpenAI GPT-4o-mini, Anthropic Claude) invoke a constrained set of backend tools under **prompt-based guardrails** that keep the assistant within product-defined bounds.
- Designed the conversational AI loop around **tool use / function calling** with **structured-output JSON schemas** for predictable, auditable responses; added **trace/observability logging**, **retries with cross-model fallbacks**, and deliberate **inference cost control** (picked GPT-4o-mini after weighing latency, cost, and instruction-following).
- Introduced **spec-driven development with AI-coding guardrails** — a structured spec and convention layer that LLMs follow when generating code, keeping the codebase consistent as features ship with AI in the loop.

Tickety (2024) — tickety.dev · Open-source JS library to bootstrap a ticketing system in minutes (Next.js + PostgreSQL).

Exoplate (2023) — exoplate.com · Online marketplace for art posters with Stripe checkout, auth, and image storage; Next.js, TypeScript, Tailwind.

EDUCATION

BSc Computer Science — Keele University, Stoke-on-Trent (2021)
